

# Biodiverse genome assemblies

How do we explain the sporadic presence of orthologs in a clade?

**Assumption:** All detected genes are encoded in the genome of the respective species

## Analysis

In this module, we will analyse the orthologs of the GH28 glycosyl hydrolase in the two invertebrates *Bradysia coprophila* and *Spodoptera litura* in more detail.

### Task 1: *Spodoptera litura*

- Find the NCBI accession ID of the GH28\_QRW23661.1 in *Spodoptera litura* using the [interactive webviewer](#)

XP\_022836218.1

- Perform a [BLASTp search](#) against the “Non-redundant protein sequences (nr)” database
- Take a look at the list of best hits. Which taxonomic clade do they represent?

### Task 2: *Bradysia coprophila*

- Repeat the analysis with the GH28\_QRW23661.1 ortholog in *Bradysia coprophila*

[https://www.ncbi.nlm.nih.gov/protein/XP\\_037031340.1](https://www.ncbi.nlm.nih.gov/protein/XP_037031340.1)

## Summary and Discussion

- Note down your observation and discuss with the group
