Headings

Within a page, you can organize the information using headings of different levels, just think of chapters, sections, subsections, and paragraphs. By default, headings up to level 3 will be included into the table of contents that is shown at the top of the page. The syntax to generate a heading is simple. A level 1 heading (top level) is generated by placing your heading text between two runs of six equal signs

```
====== YOUR L1 HEADING ======
```

Lower ranking headings are generated the same way, just decrease the number of equal signs. Please make sure, that your headings are not too long.

- Headings can be used to bring structure into your text
- Headings up to level 4 will be included into the Table of Contents
- The WIKI syntax to generate headings is a run of equal (=) signs
- You can create internal links to specific sections in a WIKI page by specifying the page address and then append the heading name (all lower case letters, white spaces replaced by an '_'). For example, the following link will bring you to the page top

  ```
  [[general:computerenvironment:tasksetwiki#project_documentation_in_a_wi
  ki|page top]]
  ```
